2. Introduction

The Contracts for Difference (CFD) scheme is managed by the CFD Counterparty, this role is performed by Low Carbon Contracts Company (LCCC).

The Metering System used by a Generator is subject to a technical assurance process. LCCC has the right to carry out an onsite audit on the Facility Metering Equipment. LCCC have outsourced this metering assurance to a Management Services Provider (MSP).

2.1 Scope and Purpose

This document has been written by EMR Settlement Ltd (EMRS) on behalf of the LCCC for the CFD scheme. It covers procedures for the MSP and Metering Agent (MA) roles. The MSP role is being fulfilled by EMRS. If you have any questions on the MSP and MA roles, please contact LCCC.

2.3 Associated Documents

This working practice should be read in conjunction with the following documents:

- CFD Standard Terms and Conditions¹ and all subsequent amendments
- CFD Agreement¹ and all subsequent amendments
- Private Network CFD Agreement¹ and all subsequent amendments
- BSCP27 – Technical Assurance of Half Hourly Metering Systems for Settlement Purposes²
- WP133 - EMR Metering Disputes Resolution Procedure

3. Background

The MSP will appoint a suitably qualified agent to check compliance to the technical specifications and perform an onsite audit of the Facility Metering Equipment. This working practice is also relevant to that nominated representative of the MSP; the MA.

In the CFD Agreement, the Generator is referred to as the Facility and the Metering System used to measure net Metered Volume is the Facility Metering Equipment.

The Metering Technical Assurance process requires that a number of onsite audits are carried out to provide assurance that the Metered Volumes submitted to EMRS are accurate. EMRS are performing the settlement role on behalf of the LCCC.

Assurance of the Metering Systems in CFD is assessed by analysing the audit results from CFD Generators. All Generators participating in CFD will be split into different risk categories. The number of onsite audits performed for each category will be determined by the net significance of the risk for that category. The risk categories in CFD are:

- Central Meter Registration Service (CMRS)/Supplier Meter Registration Service (SMRS) sites; and
- CFD Generators on Private Networks;

The Metering Test Assurance Framework is based on the existing Balancing and Settlement Code (BSC) Performance Assurance Framework (PAF) and an additional CFD Assurance Framework. This CFD Assurance Framework is for risks which are specific to CFD Generators on a Private Network and any specific risks associated with CFD Generators that are not covered by the BSC PAF.

A targeted audit for any applicable CFD Generator can occur at any time on request from LCCC.

For a CFD Generator on a Private Network there will be an onsite audit within three months of the generation Start Date (Condition 3.21¹), irrelevant of the MA witnessing the initial Commissioning and Proving Tests. This is to provide added assurance that the Metered Volumes are correct as the generator is not subject to any of the requirements and validation in the BSC.

A CFD Generator on a Private Network will be subject to regular onsite audits thereafter. These will occur every three to five years for the duration of the CFD Agreement¹. This will be up to a maximum of three subsequent audits with an audit conducted in the last year of the CFD Agreement.

The MSP will determine the sites to be audited, based on instructions from LCCC, and will inform the MA. The MA will be responsible for arranging, where requested to do so by LCCC, and in all cases conducting the onsite audit of the Facility Metering Equipment.

The Metering Technical Assurance process will confirm:

- the installed assets match the submitted details in the Operational Conditions Precedent (OCP) 2.1 (C), (D) and (E);

¹ https://www.gov.uk/government/publications/contracts-for-difference-standard-terms-and-conditions
² https://www.elexon.co.uk/bsc-related-documents/related-documents-bscps/
• the electrical schematic diagram accurately indicates the Defined Metering Point (DMP);
• perform tests to verify the energy recorded by the Facility Metering is accurate and consistent with the primary energy; and
• will also confirm the method of data submission accurately passes on Metered Volumes to EMRS.

3.1 Arrange Site Access

The CFD Generator is required to grant access (or arrange access with the Registrant of the Boundary Point Metering Equipment) to the Facility and the Facility Metering Equipment for audit purposes. This is the Metering Access Right that is part of the conditions in the CFD Agreement. The purpose of the access is to allow the Facility Metering Equipment to be read, inspected and tested to verify any relevant data.

For CMRS and SMRS Registered Generators audits will be arranged through a Metering Inspection Notice. For Private Network CFD Generators audits can be an unannounced visit or arranged through a Metering Inspection Notice (the latter if an unannounced visit is impractical due to the Facility being unmanned or due to health and safety requirements).

The onsite audit can be arranged by LCCC or this activity can be delegated to the MA by LCCC. The MA will specify who the suitably qualified person attending site will be. The MA shall at all times comply with the Health & Safety rules of the Generator and is suitably authorised and competent to exercise the Metering Access Right.

3.2 Metering Technical Assurance

The onsite test will determine if the CFD Generator has satisfied the Electrical Schematic Diagram Obligation and the Metering Compliance Obligation as required in the CFD Agreement.

The onsite test will be based on the principles of the Inspection Visits described in Appendix 4 (4.1) of BSCP27. A summary of the Metering Assurance Test is outlined below:

• Confirm that the location of the Current Transformers (CT) and Voltage Transformers (VT) (both CTs and VTs being Measurement Transformers) are at the Defined Metering Point (DMP) of the Facility and that it is in such a position to measure the net Metered Volume of the Facility;
• Confirm from the Electrical Schematic Diagram that no other circuits can impact the net Metered Volume of the Facility and give a false indication of generation; i.e. from another separate connection to the Total System, Private Network or another part of the Facility owner’s site;
• Confirm the ratio, class, rated burden and polarity of the Measurement Transformers onsite (if safe to do so). Check the Test Certificates and Commissioning Certificates of the Measurement Transformers;
• Confirm the class, serial number, programmed ratios, programmed compensations and test facilities of the Meters onsite. Check the Test Certificates and Commissioning Certificates of the Meters;
• Confirm the overall accuracy at the DMP is within the allowed limits as per the applicable Code of Practice (CoP) or Private Network Agreement Technical System Requirements (TSR), as applicable;
• Confirm the Meter Technical details onsite match those submitted and confirm these with the relevant data collection agency;

3 https://www.elexon.co.uk/bsc-related-documents/related-documents/bscps/
- Carry out a Correct Energy Measurement Check (see description in Appendix 2) to determine that the energy recorded by the meter is accurate. If possible, compare the instantaneous power recorded by the meter to an independently measured primary indication;

- Carry out a Consumption Data Comparison Check (see description in Appendix 2) to determine that one half hour period recorded by the Meter is consistent with, when read by the Data Collector (DC), Half Hourly Data Collector (HHDC) or Central Data Collection Agent (CDCA), the value held by the relevant data collector. This should be checked after the visit to confirm that EMRS has received the same value for the period (account for any applied Line Loss Factors (LLF)). This figure should also be compared with the energy measured during the Correct Energy Measurement Check. If the CFD Generator is submitting data by Comma Separated Values (CSV) file this method should be demonstrated and the file submitted to EMRS via Secure File Transfer Protocol (SFTP) to confirm the value;

- In a situation where the Meter does not have its time synchronised by a data collection system the CFD Generator will demonstrate how they synchronise the time in the meter;

- On a Private Network the voltage level of the Facility Metering Equipment and the voltage level at the Boundary Point of the Private Network to the Distribution System will be compared against that submitted as the voltage class for use in LLFs; and

- Check the quality of the installation.

If the Metering System is a BSC registered Metering System then the CFD Generator will arrange for the Meter Operator Agent (MOA) to attend, and a suitably authorised representative of the Distribution Company or National Electricity Transmission System Operator, as applicable, to attend for Measurement Transformer access.

For a Private Network a suitably authorised site electrical engineer will be present to allow access to the Meters and Measurement Transformers (if a 3rd party MOA has been used the CFD Generator must arrange for them to be on site).

### 3.3 Audit Results

The results of all audits will be passed to the MSP who in turn will inform the LCCC. If the audit result is a fail, the nature of the breach of the Metering Compliance Obligation and/or the Electrical Schematic Obligation will be detailed. The LCCC will issue the CFD Generator a Metering Breach Notice as per the relevant condition\(^4\) in the CFD Agreement terms and conditions\(^5\). It will be up to the CFD Generator to resolve this breach or appeal the decision.

\(^4\) 31.2 in standard terms and conditions, and Private Network Agreement; 30.2 in Investment Contract

# 4. Interface and Timetable Information

## 4.1 Metering Technical Assurance Process

The MSP acting on behalf of the LCCC will use an MA to carry out the Metering Technical Assurance Process.

4.2 Metering Access Right

This is the process for arranging site access for the purposes of conducting an audit of the Facility Metering Equipment. In the Private Network Agreement LCCC have the right to have access without prior notice (condition 31.16) – this process is only relevant where access is to be arranged with notice given.

7.1 Appendix 1 – Notification Templates

Metering Technical Assurance Site Access Notice

To: [●] (the “Generator”)

[CMU ID: [●]]

From: [●] (the “Metering Agent”)

[Address]

Dated: [●]

CONTRACTS FOR DIFFERENCE – METERING TECHNICAL ASSURANCE SITE ACCESS NOTICE

Dear Sirs,

As per Condition [30.11 OR 31.13 OR 31.16] in the agreement dated [●] between you as the Generator and the CfD Counterparty (the “Agreement”) the [CfD ID: [●]] is required to undergo a Metering Technical Assurance Test.

Terms and expressions defined in or incorporated into the Agreement have the same meaning when used in this notice.

The Low Carbon Contracts Company (CfD Counterparty) has requested that [Metering Agent] carry out the Metering Technical Assurance Test on their behalf.

This notice is a request for site access to perform the Metering Technical Assurance Test on [Date]. The [Generator] shall arrange access to the Facility Metering Equipment; this includes the Meters, communications equipment, Current Transformers, Voltage Transformers for all metered points.

The representative of the [Metering Agent] to conduct the Metering Test will be [Name].

If this date is not suitable the [Generator] shall respond to this notice proposing a date within twenty working days of the original requested date for access.

Yours faithfully,

....................................

For and on behalf of the Metering Agent

[DD Month YYYY]

Dear [Name],

[CONTRACT FOR DIFFERENCE/ INVESTMENT CONTRACT] – METERING COMPLIANCE OBLIGATIONS

We refer to the [Contract for Difference]/[Investment Contract] dated [DD Month YYYY] between [CID Generator Company name] (the “Generator”) and Low Carbon Contracts Company Ltd as the CFD Counterparty relating to the [Project] project (the “Project”), (the “Agreement”). Terms and expressions defined in or incorporated into the Agreement have the same meanings when used in this notice.

We further refer you to the Metering Access Right that you have been granted to exercise in respect of the Project in order to confirm compliance by the Generator with the Metering Compliance Obligation(s) set out at Condition(s) [Metering Compliance Obligations].

We confirm that, in accordance with our previous discussions, if we have been granted access to read, test or verify any relevant data and inspect and conduct tests in respect of the Facility Metering Equipment, we will be able to confirm to you whether we consider a Generator to have complied with the relevant Metering Compliance Obligations.

We confirm that we have been granted access to read, test or verify any relevant data and inspect and conduct tests in respect of the Facility Metering Equipment. We can accordingly provide you with confirmation that in our view the Generator is compliant with the Metering Compliance Obligation(s) referred to above.

Kind regards,

EMR Metering Team, for and on behalf of
EMR Settlement Limited

* Definitive notes for EMRS. All references to the Metering Compliance Obligations that EMRS have been asked to check... Metering Compliance Obligations are at Condition 31.4 for ICS, Condition 31.7 for AHS and AEP CFDs (excluding private network CFDs), and Condition 31.16 as inserted by paragraph 8 of the front end CFD Agreement for private network CFDs.
Metering Non-Compliance Notice

[DD Month YYYY]

Dear [Name],

[CONTRACT FOR DIFFERENCE]/[INVESTMENT CONTRACT] – METERING COMPLIANCE OBLIGATIONS

We refer to the [Contract for Difference]/[Investment Contract] dated [DD Month YYYY] between [CFD Generator Company name] (the “Generator”) and Low Carbon Contracts Company Ltd as the CFD Counterparty relating to the [Project] project (the “Project”), (the “Agreement”). Terms and expressions defined in or incorporated into the Agreement have the same meanings when used in this notice.

We further refer you to the Metering Access Right that you have asked us to exercise in respect of the Project in order to confirm compliance by the Generator with the Metering Compliance Obligation(s) set out at Condition(s) [Metering Compliance Obligations].

We confirm that, in accordance with our previous discussions, if we have been granted access to read, test or verify any relevant data and inspect and conduct tests in respect of the Facility Metering Equipment, we will be able to confirm to you whether we consider a Generator to have complied with the relevant Metering Compliance Obligations.

We confirm that we have been granted access to read, test or verify any relevant data and inspect and conduct tests in respect of the Facility Metering Equipment. We can accordingly provide you with confirmation that in our view, for the reasons set out below, the Generator is not compliant with the Metering Compliance Obligation(s) referred to above.

Reasons for non-compliance:

[ ]

Kind regards,

EMR Metering Team for and on behalf of
EMR Settlement Limited

*Drafting note for EMRS: Last references to Metering Compliance Obligations that EMRS have been asked to check – Metering Compliance Obligations are at Condition 30.1 for ICs, Condition 31.1 for AR1 and AR2 CFDs (excluding private network CFDs), and Condition 31:16 as inserted by paragraph 8 of the front end CFD Agreement for private network CFDs.
7.2 Appendix 2 – Onsite Tests

- Correct Energy Measurement Check

To verify that the Metering System is recording the correct amount of energy, checks shall be carried out that compare the primary load with that being recorded by the Metering System. However, due to the possible restrictive physical location of the primary conductors and Plant at an installation, access may be limited. Where this is the case, other suitable methods may be used to determine correct measurement.

Sites installations can be divided up into the following three categories:

i. LV whole current;
ii. LV, CT operated; and
iii. HV, CT & VT operated.

Sites that fall into categories (i) and (ii) will prove to be the most accessible for prevailing load checks. Sites in category (iii) may be more difficult to access, but it is often possible to use a clip-on ammeter around the current transformer cables where access to switchgear is restricted.

Note: When all preferred methods of checking the prevailing load fails, other suitable engineering methods may be adopted to establish correct measurement.

Methods of establishing primary load (in order of preference):

i) The demand (derived from independently measured primary values) shall be compared to the Meter’s instantaneous demand reading for the same period; or
ii) The demand (derived from independently measured secondary values where the primary/secondary ratios can be established) shall be compared to the Meter’s demand reading for the same period; or
iii) Where appropriate an alternative measurement device shall be used for comparison with that of the Meter; or
iv) The CfD Generator shall provide the MA with appropriate commissioning records. The MA is required to establish that these details sufficiently verify that the Meter has been proven to be operating correctly during commissioning; or
v) In the event that none of the above is possible, the MA will notify MSP giving the reasons. (This recognises that if (i) to (iv) are not possible additional checks do not add value).

- Consumption Data Comparison Check

The MA shall compare the metered energy data for one half hour recorded at the time of the Metering Test with the consumption data held by the DC, HHDC or CDCA for that same half-hour period. If the values differ by more than agreed tolerances the MA will note the non-compliance.

This check can take place on site or off site at the discretion of the MA and either method forms part of the audit.

The tolerances to be used will be those agreed from time to time by MSP/LCCC.

In order to obtain and verify stored Meter data values that are eventually transferred to the DC, HHDC or CDCA, it will be necessary to compare with the Meter’s (displayed) cumulative advance over the same half hour period. The kWh/MWh value will also be compared with the measured value obtained from the Correct Energy Measurement Check.

This Consumption Data Comparison Check shall take the following format:

a) Compare the Meter Technical Details provided by the CfD Generator with that observed onsite. Consideration should also be given to commissioning and historic proving test information.

b) Take a reading (for the dominant Active Energy flow direction at the time) of the cumulative register on the Meter’s display at the beginning and end of the same half
hour period that is to be downloaded from the Meter’s Outstation and requested from the CDCA, HHDC or DC.

c) Using the Meter Register Multiplier, calculate the true Meter register half hour advance for that half hour period. This cumulative Meter register half hour advance shall also be used to confirm the findings from the Correct Energy Measurement Check where, ideally, the readings for that check were taken within the same half hour period and the load (or generation) was relatively constant during that period. The MA shall use its discretion, bearing in mind the predictability of the load (or generation), where the readings weren’t taken in the same half hour period.

d) Request the current actual consumption data held by the CDCA, HHDC or DC for the same half hour period and compare the energy recorded by the Meter (cumulative Meter register half hour advance) and its associated Outstation(s) (half hour value) with the energy value held in the CDCA, HHDC or DC systems which will be submitted to EMRS.

One Active Energy channel will be requested. In CfD this will normally be the Active Export channel.
